

Making Your Mobile Website Work Like An iPhone App

(This works with the most recent update to the iPhone IOS 6.0, and was not tested on other iPhones with older software updates. To update your software or see what software you're currently running; go to Settings, General, Software Update.)

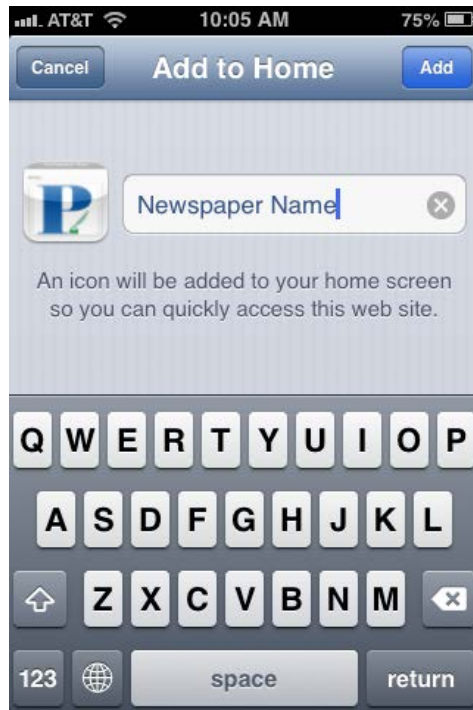

Step 1

Open your mobile website in your Safari browser. If you have given us a logo to set as your home page, it should be what you see when the website opens. Click on the middle icon at the bottom of screen (arrow in box).

Step 2

This screen will appear, click on the middle icon that says, "Add to Home Screen", it should show you the image of what your Home Screen icon will look like.

Step 3

This screen will appear, enter a title that will appear on the home screen. Then click the blue “Add” in the top right hand corner.

Step 4

You will be able to see the Icon/Bookmark you just added, you can drag and drop it where you want it positioned on your iPhone screen. This App example appears at the top left hand corner (the 1st icon). When you click on the icon, it will take you directly to the mobile website, just like an App.
